

EXP.NO.1

Introduction

Biomedical engineers also work **to advance the efficacy of natural processes through biotechnology, such as tissue regeneration and cell diffusion**. Biomedical engineers can be found in almost all fields of medicine — wherever there's a problem that impacts human health, they work to find a solution

The purpose of biology lab is **to deepen your understanding of the scientific method of inquiry and expand your knowledge of living things and what they need to sustain life through experimental observations**.

In this class, students will **learn about lab safety and explore topics like the metric system using the microscope and the scientific method**. Students will learn how cells grow and divide, obtain and use energy, and pass genetic information to the next generation..
