# Ohm's Law

## Objective

This exercise examines Ohm's law, one of the fundamental laws governing electrical circuits. It states that voltage is equal to the product of current times resistance.

### Theory Overview

Ohm's law is commonly written as V = I \* R. That is, for a given current, an increase in resistance will result in a greater voltage. Alternately, for a given voltage, an increase in resistance will produce a decrease in current. As this is a first order linear equation, plotting current versus voltage for a fixed resistance will yield a straight line. The slope of this line is the conductance, and conductance is the reciprocal of resistance. Therefore, for a high resistance, the plot line will appear closer to the horizontal while a lower resistance will produce a more vertical plot line.

### Procedure

- 1. Build the circuit of Figure 4.1 using the 1  $k\Omega$  resistor. Set the DMM to measure DC current and insert it in-line between the source and resistor. Set the source for zero volts. Measure and record the current in Table 4.1. Note that the theoretical current is 0 and any measured value other than 0 would produce an undefined percent deviation.
- 2. Setting E at 2 volts, determine the theoretical current based on Ohm's law and record this in Table 4.1. Measure the actual current, determine the deviation, and record these in Table 4.1. Note that Deviation = 100 \* (measured theory) / theory.
- 3. Repeat step 2 for the remaining source voltages in Table 4.1.
- 4. Remove the 1 k $\Omega$  and replace it with the 6.8 k $\Omega$ . Repeat steps 1 through 3 using Table 4.2.
- 5. Remove the 6.8 k $\Omega$  and replace it with the 33 k $\Omega$ . Repeat steps 1 through 3 using Table 4.3.
- 6. Using the measured currents from Tables 4.1, 4.2, and 4.3, create a plot of current versus voltage. Plot all three curves on the same graph. Voltage is the horizontal axis and current is the vertical axis.

## Questions

- 2. Is there a linear relationship between current and voltage?
- 3. What is the relationship between the slope of the plot line and the circuit resistance?
