

Al-Mustaqbal University
College of Engineering and Technology
Department of Medical Instrumentation Techniques
Engineering
Class: First Class
Subject: Principle of Computer
Lecturer: Dr. Myasar Mundher Adnan
Lecture Address: Basic Concept of computer
2024 - 2025

Chapter One: Basic Concepts of Information Technology

Introduction to Computers

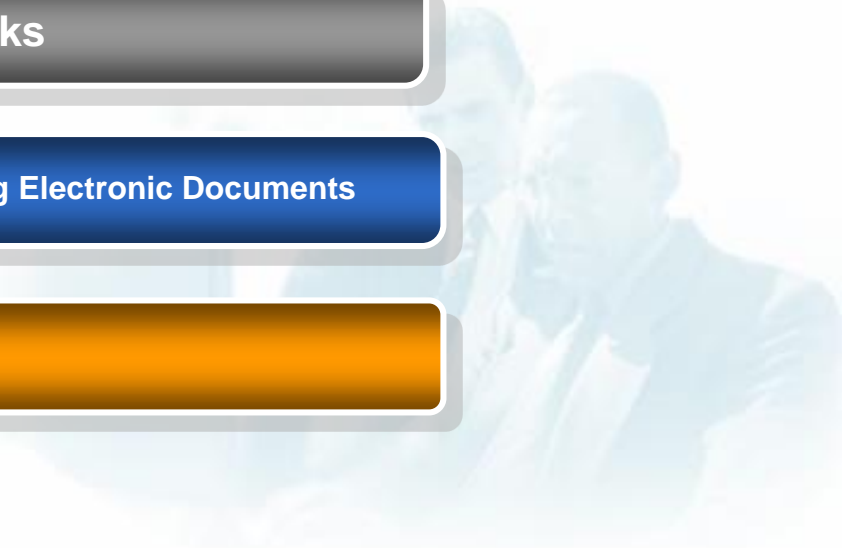

Computer Components (Hardware and Software)

Applications of Computers in Society

Introduction to Computer Networks

Software Development and Benefits of Using Electronic Documents

Computer Viruses

Chapter One: Basic Concepts of Information Technology

Introduction to Computers

Definition of a Computer

- **Definition of a Computer:**
It is an electronic device capable of storing data, processing it to extract information, and retrieving it again whenever requested.
- **Information and Data:**
The inputs to the device are called data, which the computer processes or stores, while the outputs are referred to as information or results.

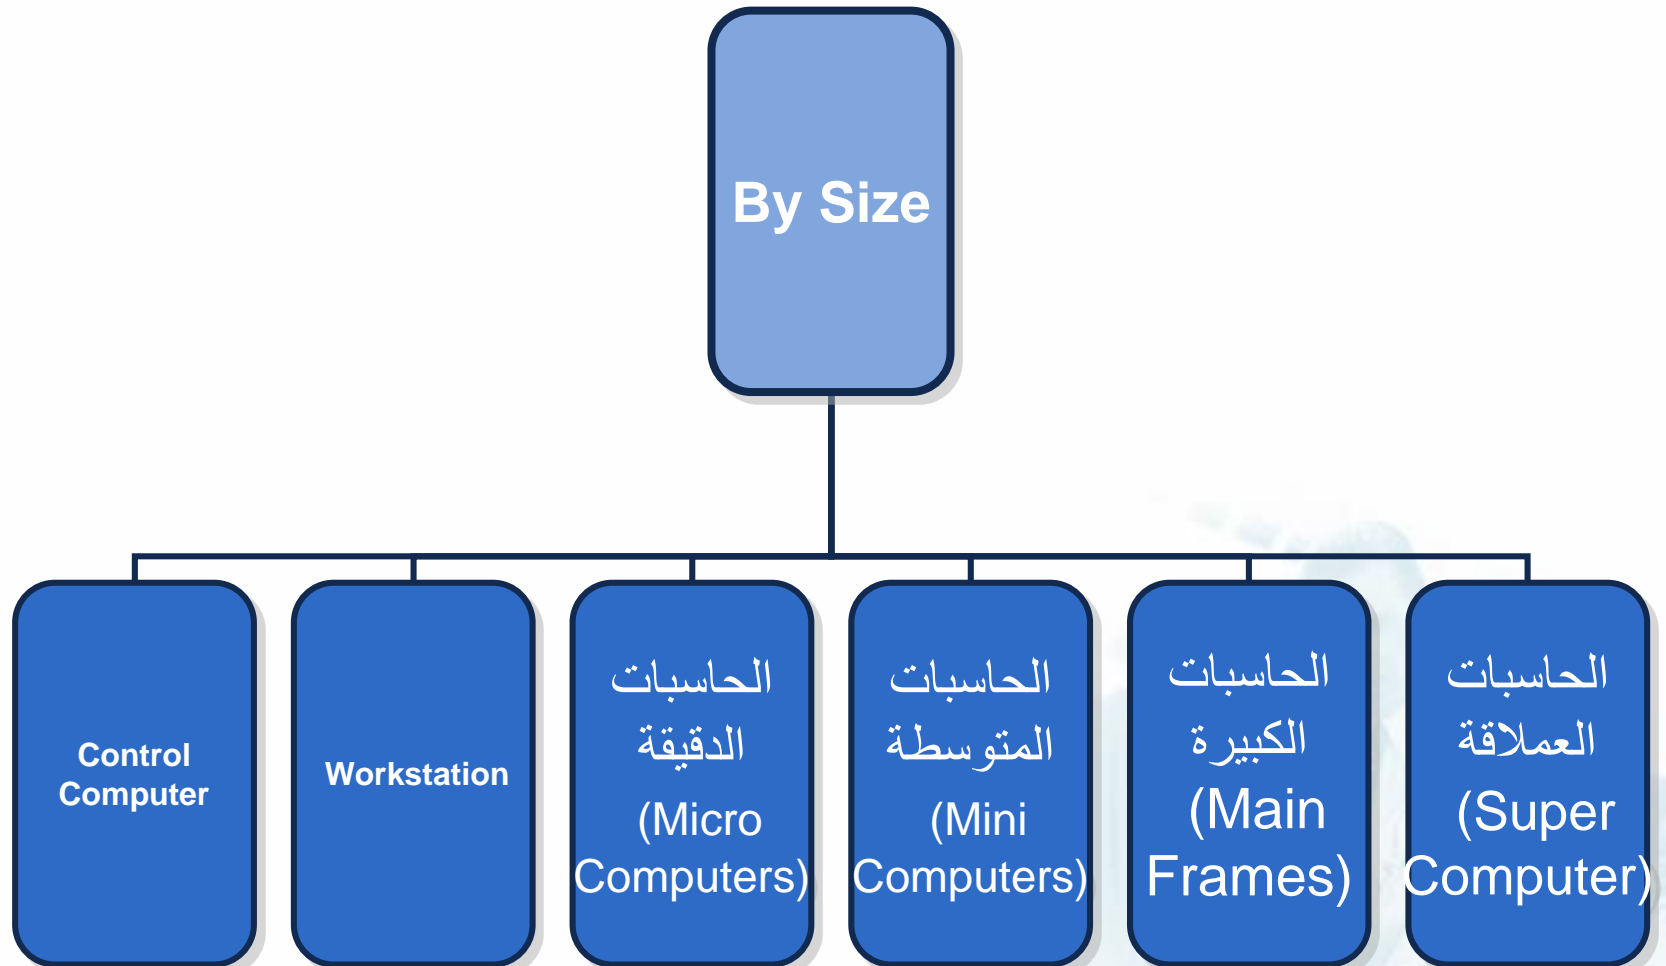

Features of Computers:

- **Speed:** Performs calculations and processes data quickly.
- **Accuracy:** The error rate is so minimal that it can be disregarded.
- **Storage Capability:** Stores vast amounts of information on internal (internal storage) or external disks (external storage).
- **Cost Efficiency:** Economical in terms of both cost and time.
- **Network Communication:** Provides fast networking services, saving time, effort, and costs, such as through global network services (web, Internet).

Types of computers (according to size):

Types of computers (according to size):

الحاسبات العملاقة (Super Computer):

- These are extremely fast machines capable of running dozens of programs simultaneously.
- They can store billions of characters in memory, utilizing the latest technological advancements for this purpose.
- Supercomputers can be connected to hundreds of peripheral devices.
- The cost of such devices can reach millions of dollars.
- They are exclusively used in fields like governmental scientific research, universities, and industrial application centers .

Types of computers (according to size):

الحاسبات الكبيرة (Main Frames):

- **Mainframe Computers:**
- They are characterized by their extremely high speed.
- They have the ability to serve hundreds of users simultaneously.
- They possess a large storage capacity.
- These computers are often connected to terminals and are commonly used in large companies and universities.

Types of computers (according to size):

الحاسبات المتوسطة (Mini Computers):

- They are smaller in size, have less storage capacity, and operate at lower speeds compared to mainframe computers.
- Suitable for small to medium-sized businesses, industrial control operations, and information communications.
- They typically require no more than eight individuals to operate.
- They are less expensive than mainframe computers .

Types of computers (according to size):

الحاسبات الدقيقة (Micro Computers):

1. The smallest type in size, with limited storage capacity.
2. Also known as personal or home computers (Personal Computers).
3. They perform non-complex, general-purpose tasks.
4. Considered the cheapest type of computers and can only be used by one person at a time.

Chapter One: Basic Concepts of Information Technology

The components of a computer

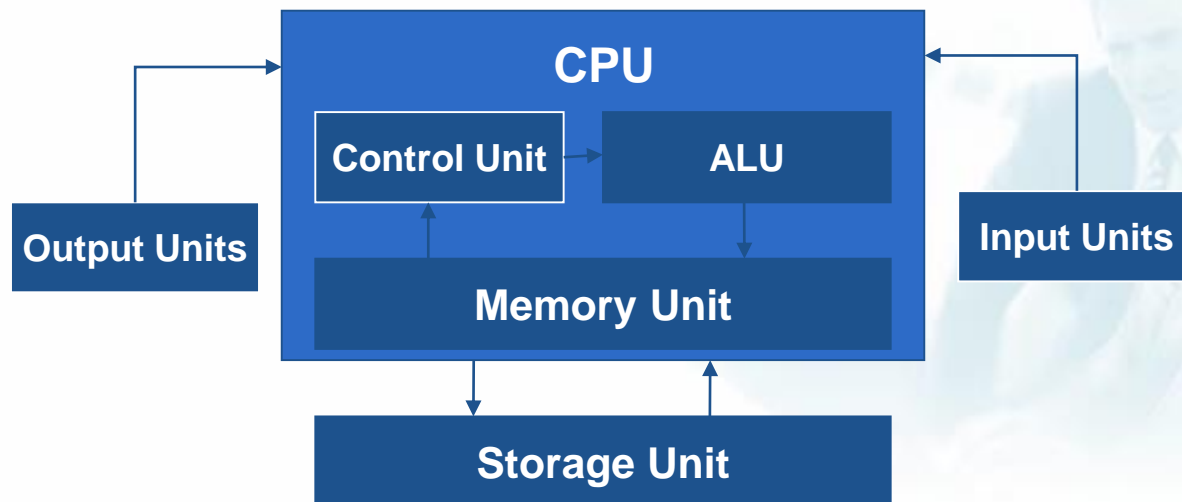

مكونات الحاسب

المكونات المادية Hardware

1. (Processing Unit)
2. (Memory Unit)
3. (Input Units)
4. (Output Units)
5. (Storage Unit)

وحدة المعالجة المركزية (Processing Unit)

**Arithmetic and Logic Unit
“ALU”**

Control Unit

The unit of CPU speed is megahertz (MHz).

Central Processing Unit (CPU)

Central Processing Unit (CPU)

The Central Processing Unit (CPU) is similar to the human brain in its work, and it controls all arithmetic and logical operations, and is divided into:

- Control Unit:** This is the part that controls all parts of the computer, and through it instructions are sent from one part to another.
- Arithmetic and Logic Unit:** This is the part that performs all arithmetic and logical operations in the computer.

وحدة الذاكرة (Memory Unit)

Type of Memory

ROM

- Read-Only Memory (ROM)
- It does not lose its contents when the device is powered off.
- It stores essential data needed for the device to start up, such as information about connected input and output devices and operating system files.
- Its data can only be modified by specialized programmers.

RAM

- Random Access Memory (RAM)
- It loses its contents once the device is powered off.
- It is used to temporarily store data while working on the device and files that are changeable or can be written to.
- It is a user-accessible memory, allowing the user to interact with and modify its data.

Input Units

Output Units

In addition to plotters for creating large prints, such as architectural designs.

Units used for input and output:

Touch Screen

Infrared (IR) Devices and Bluetooth Devices:

Storage Unit

External Storage Units
(Floppy Disk, Flash
Memory, External Hard
Drive)

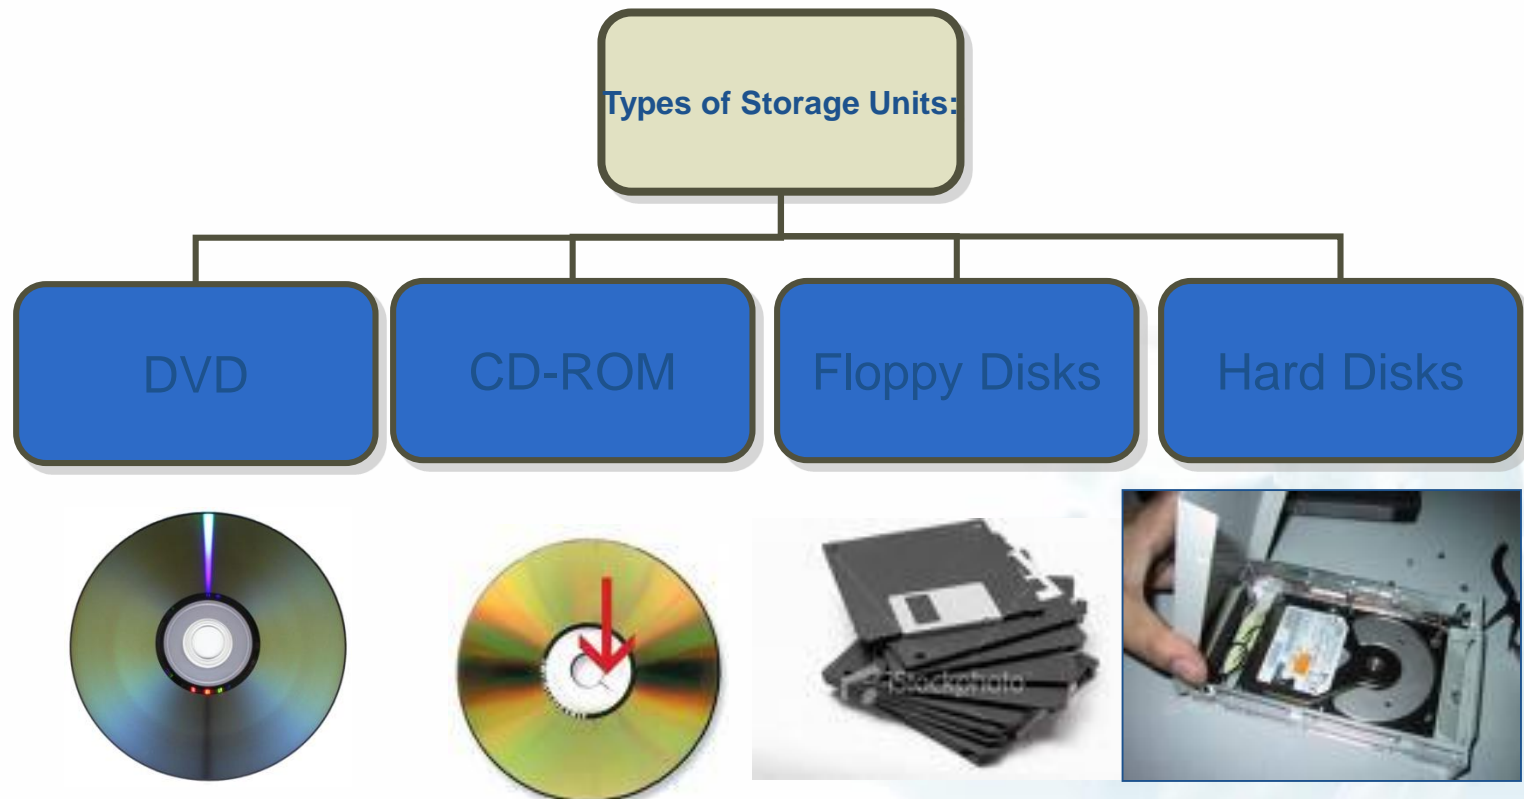

Internal Storage Units
(Hard Disks الأقراص الصلبة)

Storage Unit

They are used to store data, which can be retrieved upon the user's request. These units do not lose their contents when the device is powered off.

Note: The term "optical discs" refers to both digital discs and compact discs (CDs) because they use laser technology for data storage.

Storage Unit
