Visualizing data with charts

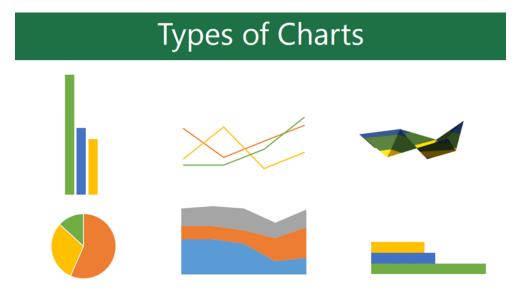

Introduction

It can be difficult to interpret Excel workbooks that contain a lot of data. **Charts** allow you to illustrate your workbook data **graphically**, which makes it easy to visualize **comparisons** and **trends**.

Understanding charts

Excel has several **types of charts**, allowing you to choose the one that best fits your data. To use charts effectively, you'll need to understand how different charts are used.

Click the arrows in the slideshow below to learn more about the types of charts in Excel.

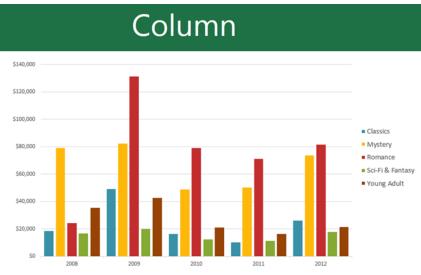

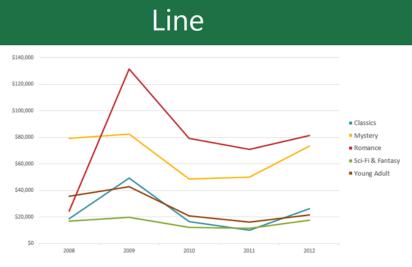

Radiology Technique Department

Excel has a variety of chart types, each with its own advantages. Click the arrows to see some of the different types of charts available in Excel.

Column charts use vertical bars to represent data. They can work with many different types of data, but they're most frequently used for comparing information.

Line charts are ideal for showing trends. The data points are connected with lines, making it easy to see whether values are increasing or decreasing over time.

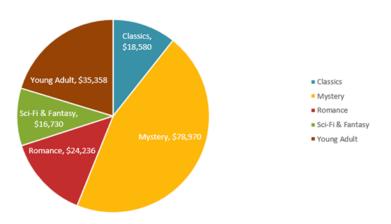

•

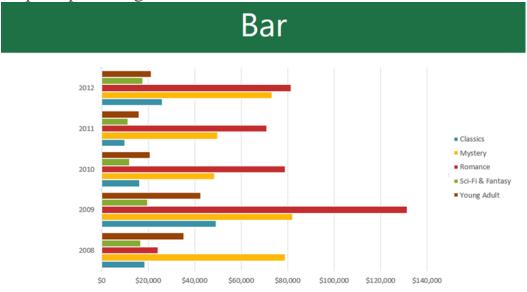

Pie

Pie charts make it easy to compare proportions. Each value is shown as a slice of the pie, so it's easy to see which values make up the percentage of a whole.

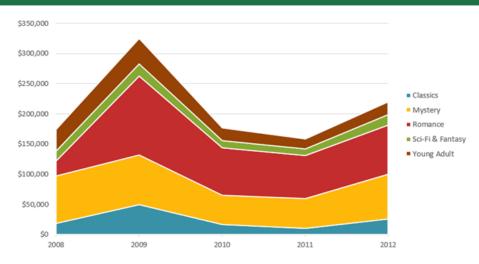

Bar charts work just like column charts, but they use horizontal rather than vertical bars.

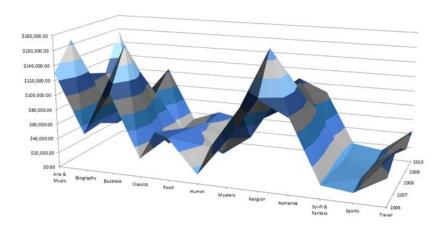

Area charts are similar to line charts, except the areas under the lines are filled in.

Surface

Surface charts allow you to display data across a 3D landscape. They work best with large data sets, allowing you to see a variety of information at the same time.

In addition to chart types, you'll need to understand how to **read a chart**. Charts contain several elements, or parts, that can help you interpret data.

Click the buttons in the interactive below to learn about the different parts of a chart.

To insert a chart:

1. Select the **cells** you want to chart, including the **column titles** and **row labels**. These cells will be the source data for the chart. In our example, we'll select cells A1:F6.

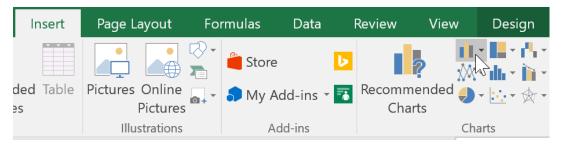

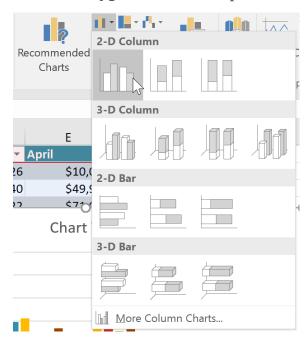

Radiology Technique Department

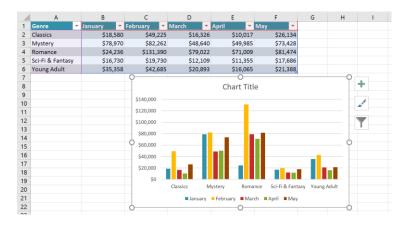

2. From the **Insert** tab, click the desired **Chart** command. In our example, we'll select **Column**.

3. Choose the desired **chart type** from the drop-down menu.

4. The Selected chart will be inserted into the worksheet.

If you're not sure which type of chart to use, the **Recommended Charts** command will suggest several charts based on the source data.

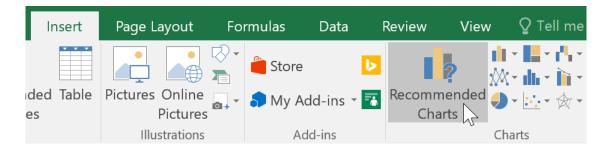

Chart and layout style

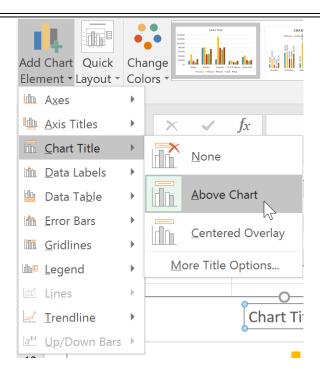

After inserting a chart, there are several things you may want to change about the way your data is displayed. It's easy to edit a chart's **layout** and **style** from the **Design** tab.

• Excel allows you to add **chart elements**—including **chart titles**, **legends**, and **data labels**—to make your chart easier to read. To add a chart element, click the **Add Chart Element** command on the **Design** tab, then choose the **desired element** from the dropdown menu.

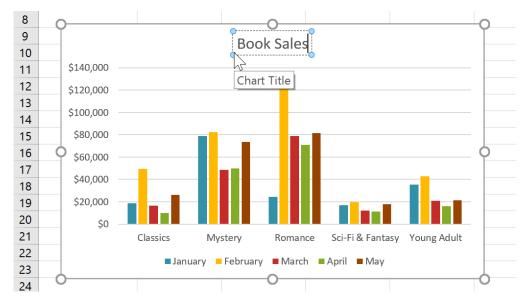

Radiology Technique Department

• To **edit** a chart element, like a **chart title**, simply double-click the **placeholder** and begin typing.

 If you don't want to add chart elements individually, you can use one of Excel's predefined layouts. Simply click the Quick Layout command, then choose the desired layout from the dropdown menu.

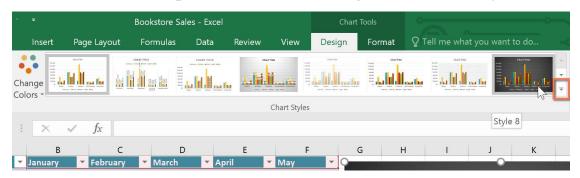

• Excel also includes several **chart styles**, which allow you to quickly modify the look and feel of your chart. To change the chart style, select the **desired style** from the **Chart styles** group. You can also click the drop-down arrow on the right to see more styles.

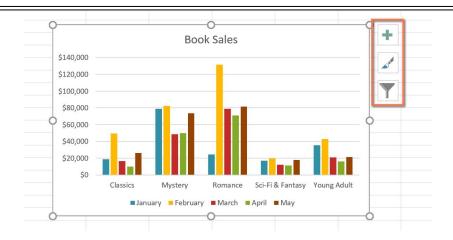

You can also use the chart formatting shortcut buttons to quickly **add chart elements**, change the **chart style**, and **filter** chart data.

Other chart options

There are many other ways to customize and organize your charts. For example, Excel allows you to **rearrange** a chart's data, change the **chart type**, and even **move** the chart to a different location in a workbook.

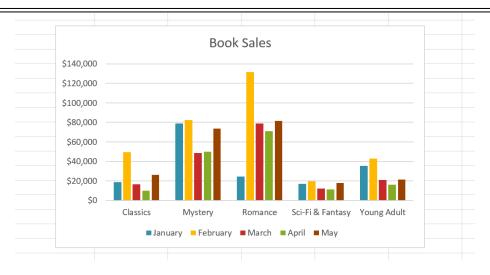

To switch row and column data:

Sometimes you may want to change the way charts **group** your data. For example, in the chart below Book Sales data is grouped **by genre**, with columns for **each month**. However, we could switch the rows and columns so the chart will group the data **by month**, with columns for **each genre**. In both cases, the chart contains the same data—it's just organized differently.

- 1. Select the **chart** you want to modify.
- 2. From the **Design** tab, select the **Switch Row/Column** command.

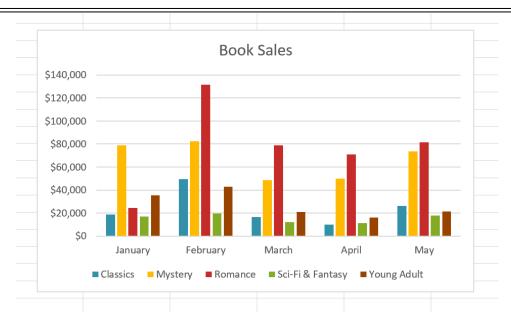

3. The rows and columns will be **switched**. In our example, the data is now grouped by month, with columns for each genre.

To change the chart type:

If you find that your data isn't working well in a certain chart, it's easy to switch to a new chart type. In our example, we'll change our chart from a column chart to a line chart.

1. From the **Design** tab, click the **Change Chart Type** command.

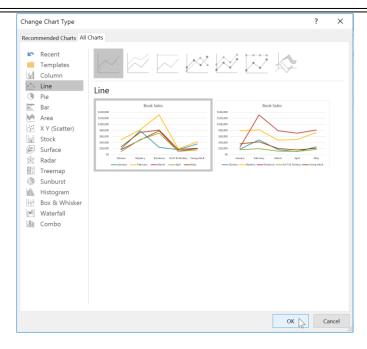

2. The **Change Chart Type** dialog box will appear. Select a new chart **type** and **layout**, then click **OK**. In our example, we'll choose a **Line** chart.

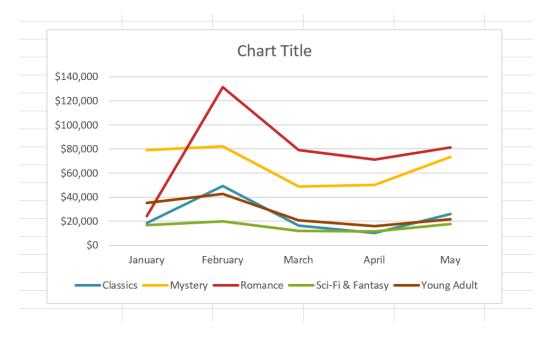

3. The selected chart type will appear. In our example, the line chart makes it easier to see trends in sales data over time.

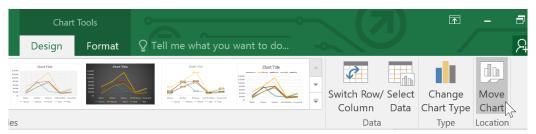

Radiology Technique Department

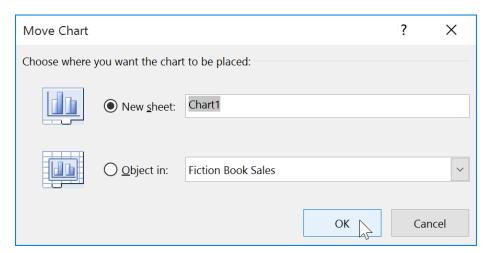

To move a chart:

Whenever you insert a new chart, it will appear as an object on the same worksheet that contains its source data. You can easily **move** the chart to a **new worksheet** to help keep your data organized.

- 1. Select the **chart** you want to move.
- 2. Click the **Design** tab, then select the **Move Chart** command.

- 3. The **Move Chart** dialog box will appear. Select the **desired location** for the chart. In our example, we'll choose to move it to a **New sheet**, which will create a new worksheet.
- 4. Click OK.

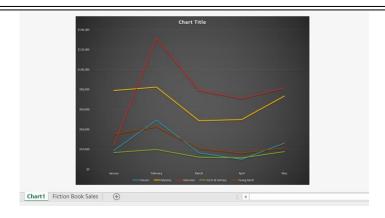

5. The chart will appear in the selected location. In our example, the chart now appears on a new worksheet.

Keeping charts up to date

By default, when you add more data to your spreadsheet, the chart may not include the new data. To fix this, you can adjust the **data range**. Simply click the chart, and it will highlight the data range in your spreadsheet. You can then click and drag the **handle** in the lower-right corner to change the data range.

| В | С | D | Е | F |
|----------|-----------|----------|----------|----------|
| January | February | March | April | May |
| \$18,580 | \$49,225 | \$16,326 | \$10,017 | \$26,134 |
| \$78,970 | \$82,262 | \$48,640 | \$49,985 | \$73,428 |
| \$24,236 | \$131,390 | \$79,022 | \$71,009 | \$81,474 |
| \$16,730 | \$19,730 | \$12,109 | \$11,355 | \$17,686 |
| \$35,358 | \$42,685 | \$20,893 | \$16,065 | \$21,388 |
| | | | , | 8 |

If you frequently add more data to your spreadsheet, it may become tedious to update the data range. Luckily, there is an easier way. Simply format your source data as a **table**, then create a **chart based on that table**. When you add more data below the table, it will automatically be included in both the table and the chart, keeping everything consistent and up to date.
